DMT Certification Examination Guidelines

DMT certification is based upon a series of mandatory pre-requisites. They include:

1. Completion of a NBDHMT approved DMT training course
2. Completion of a DOT recognized EMT curriculum.
3. Medical determination of fitness to work in pressurized environments

Once all of the above have been satisfactorily undertaken the DMT can apply to take the DMT certification examination.

The DMT examination test bank comprised of questions from seven categories. All questions are multiple-choice and have only one correct answer. No questions are designed to trick the examinee. Listed below are the seven categories, topics covered within each category, the percentage of questions from the entire examination that are derived from each category, and how many questions each respective percentage represents. Numerous variations of the DMT examination question bank are in use at any given time.

A scientific calculator may be used.

Category 1: Physics and Physiology

Defining pressure (absolute, gauge, barometric); measuring pressure (standard/imperial, metric); converting pressure (absolute to gauge - gauge to absolute in fsw, msw, ATA); converting degrees Fahrenheit to degrees Celsius; gas law definitions and computations (Boyle’s, Dalton’s, Henry’s and Guy-Lussac’s); computing oxygen percent and oxygen/nitrogen partial pressures involving various depths and various breathing mixtures; factors influencing inert gas uptake and elimination; USN definitions of treatment and emergency gases.

Nine Category 1 questions are selected from the examination question bank. They represent 7.5% of the total questions in each individual examination.
Category 2: **Decompression Sickness & Cerebral Arterial Gas Embolism**

Basic pathophysiology of decompression illness; surface orientated and saturation diving induced cases; symptom presentation; differential diagnosis Type 1 vs. Type 2 DCS, DCS-CAGE, inner ear DCS-inner ear barotrauma; risk factors;

**Eighteen Category 2 questions are selected from the examination question bank. They represent 15% of the total questions in each individual examination.**

Category 3: **Patient Assessment**

Shock; Glasgow Coma Scale; extremity injuries; anticipated physical and/or neurological findings in DCS, CAGE, ear and other barotraumas, pneumothorax, tension pneumothorax, subcutaneous emphysema; differential diagnosis; tuning fork hearing acuity testing; otoscopic findings in barotrauma and infection; omitted decompression.

**Thirty Category 3 questions are selected from the examination question bank. They represent 25% of the total questions in each individual examination.**

Category 4: **Recompression Treatment & Decompression Procedures**

US Navy treatment of surface orientated and saturation diving-induced DCS; US Navy treatment procedures for CAGE; incomplete relief of DCS during treatment and upon surfacing; omitted decompression.

**Twenty-seven Category 4 questions are selected from the examination question bank. They represent 22.5% of the total questions in each individual examination.**

Category 5: **Invasive Procedures**

Emergent/field management of pneumothorax; routes of medication administration; nasogastric tubes; wound closure; sterile technique; airway control; Foley catheters; intravenous fluid administration and drip rate calculations; endotracheal tubes; dosing conversions, mg to ml; potential compression complications for ampoules, vials and fluid infusion bottles; Heimlich valves.
Twelve Category 5 questions are selected from the examination question bank. They represent 10% of the total questions in each individual examination.

Category 6: Other Diving Related Injuries, Side Effects & Complications

Central nervous system oxygen toxicity; pulmonary oxygen toxicity; barotraumas; marine envenomation, stings and bites; nitrogen narcosis; hypothermia.

Eighteen Category 6 questions are selected from the examination question bank. They represent 15% of the total questions in each individual examination.

Category 7: Chamber, Equipment and Operational Safety

Diagnostic equipment precautions under pressure; chamber ventilation; chamber fire precautions; atmospheric sampling; tender/medic decompression safety, locking in drugs and fluids.

Six Category 7 questions are selected from the examination question bank. They represent 5% of the total questions in each individual examination.

**Suggested additional reading to DMT training course materials**

**United States Navy Diving Manual Revision 7; 2016**

**Chapters:**
- 2.9 Pressure in diving
- 2.10 Gases in diving
- 2.11 Gas laws
- 2.12 Gas mixtures
- 3.6 Mechanical effects of pressure – during descent
- 3.7 Mechanical effects of pressure – during ascent
- 3.8 Pulmonary overinflation syndromes
- 3.9 Indirect effects of pressure
- 3.10 Thermal problems in diving
- 17.3 Arterial gas embolism
- 17.4 Decompression sickness
- 17.5 Recompression treatments for diving disorders
- 17.6 Treatment tables
- 17.8 Recompression Chamber Life-Support Consideration
- 17.9 Oxygen toxicity during treatment
- 5A Neurological examination
- 5C-3 Venomous marine animals
- 5C-4 Poisonous marine animals

**Diving & Subaquatic Medicine, Fourth Edition, 2002**

by Carl Emonds, Christopher Lawry, John Pennefather & Robyn Walker

**Chapters**
- 2 Physics & physiology
- 7 Ear barotrauma
- 12 Decompression sickness: clinical
- 17 Oxygen toxicity
- 28 Cold and hypothermia
- 32 Venom marine animals
- 68 Deep and saturation diving problems
- 6 Pulmonary barotrauma
- 9 Other barotrauma
- 13 Decompression sickness: treatment
- 27 Thermal problems and solutions
- 31 Trauma from marine creatures
- 40 Neurological disorders and diving
